

IMPORTANT WEBSITE DIRECTION — ZYVORIS PUBLIC WEBSITE

The ZYVORIS website is primarily a public-facing corporate and product information website.

It is NOT intended to look like the logged-in ZYVORIS application itself.

The purpose of the website is to explain ZYVORIS clearly and professionally to:

- Fund Managers
- AIFMs
- Fund Administrators
- Tax Firms
- Accounting Firms
- Institutional Investors
- Potential strategic partners
- Potential investors
- Prospective employees

The website should help a new visitor understand within approximately 30–60 seconds:

1. What ZYVORIS is
2. What problem ZYVORIS solves
3. Who ZYVORIS is built for
4. Which tax workflows ZYVORIS supports
5. How the technology works at a high level
6. How AI is used
7. How calculations remain controlled and traceable
8. Which jurisdictions are supported or planned
9. How ZYVORIS integrates with existing systems
10. Why ZYVORIS is different from traditional tax workflows
11. Why a professional organization should trust ZYVORIS
12. How to contact ZYVORIS or request a demo

The page must therefore behave primarily as an institutional B2B information and conversion website.

1. VISUAL PHILOSOPHY

The website should feel like:

Institutional

Finance

+

Enterprise

Technology

+

Private

Markets

+

Modern Tax Infrastructure

It should NOT feel like:

- a crypto startup
- a generic AI startup
- a dashboard-only product
- a consumer SaaS product
- a consulting firm website
- an online tax calculator

The current dark ZYVORIS visual identity should be maintained.
However, the homepage should combine:

- strong editorial typography
- product explanation
- architecture illustrations
- structured information
- workflow diagrams
- selective product screenshots
- trust and governance information
- conversion CTAs

Product UI screenshots should be used selectively as supporting evidence.
They should not dominate the entire homepage.

2. PRIMARY WEBSITE OBJECTIVE

The website has three main objectives.

A. Explain

Visitors should understand the ZYVORIS proposition without needing a product demonstration.

B. Establish Credibility

The website must communicate that ZYVORIS is being built as serious institutional tax infrastructure for private markets.

C. Convert

The website should guide relevant visitors toward:

- Requesting a demo
 - Contacting ZYVORIS
 - Exploring a jurisdiction
 - Exploring a use case
 - Learning about the platform
-

3. HOMEPAGE STORY

The homepage should follow a clear narrative.

STEP 1 — WHAT IS ZYVORIS?

Tax Infrastructure for Private Markets.

STEP 2 — WHY DOES THIS MATTER?

Private-market tax reporting is fragmented, manual and increasingly complex.

STEP 3 — WHAT DOES ZYVORIS CHANGE?

ZYVORIS connects fund data, tax logic, calculations, validation and reporting.

STEP 4 — HOW DOES IT WORK?

Show the controlled workflow from source data to final tax reporting.

STEP 5 — WHAT CAN IT DO?

Show real use cases and jurisdictions.

STEP 6 — WHY IS THE TECHNOLOGY DIFFERENT?

Explain deterministic calculation logic, AI assistance and traceability.

STEP 7 — WHO IS IT FOR?

Explain customer segments.

STEP 8 — CAN WE TRUST IT?

Show governance, security principles and human oversight.

STEP 9 — HOW DOES IT FIT INTO OUR EXISTING STACK?

Show integrations and APIs.

STEP 10 — WHAT SHOULD THE VISITOR DO NEXT?

Book a demo or contact ZYVORIS.

4. HOMEPAGE VISUAL BALANCE

The homepage should approximately use the following visual balance:

40% Editorial / Information

Large headlines, clear product explanations and educational content.

25% Technical Visualizations

Architecture diagrams, workflow diagrams, traceability flows and jurisdiction architecture.

20% Product UI

Actual or realistic ZYVORIS product screenshots.

15% Trust / Conversion Content

Security, target users, CTA sections, contact elements and company positioning.

Do not build every section as a dashboard screenshot.

5. HERO SECTION

The Hero should look primarily like an enterprise website.

LEFT:

TAX INFRASTRUCTURE FOR PRIVATE MARKETS

Turn complex fund data into jurisdiction-ready tax reporting.

ZYVORIS connects financial data, fund structures, tax logic, calculations and reporting in one controlled infrastructure layer built for cross-border private markets.

[Book a Demo]

[Explore the Platform]

RIGHT:

Use a clean conceptual infrastructure illustration.

Example:

Source

→

Structure

→

Tax

→

Calculation

→ Reporting Output

Data

Mapping

Logic

Engine

Do NOT use a large full application dashboard in the Hero.

The user should first understand the concept before seeing the software.

6. PROBLEM SECTION

This section should be primarily informational.

Headline:

Private markets have scaled. Tax infrastructure has not.

Use four clean explanatory cards:

Fragmented Data

Manual Tax Logic

Cross-Border Complexity

Limited Traceability

The purpose is to make potential customers recognize their own operating problems.

This is a marketing and educational section, not a product UI section.

7. PLATFORM SECTION

Headline:

One infrastructure layer for fund tax reporting.

This section explains the conceptual ZYVORIS architecture.

Show:

Data		Layer
Structure		Layer
Tax	Logic	Layer
Calculation		Engine
AI	Intelligence	Layer
Reporting Layer		

Each should have a brief explanation.

This should look like a modern technology architecture illustration.

It should NOT look like six separate application windows.

8. WORKFLOW SECTION

Headline:

From source data to tax reporting in one controlled workflow.

Show:

CONNECT	
→	STRUCTURE
→	CLASSIFY
→	CALCULATE
→	ALLOCATE
→	VALIDATE
→ REPORT	

Use minimal icons and one line of explanation per stage.

Potential customers should immediately understand the operating model.

9. PRODUCT SCREENSHOT SECTION

Only after ZYVORIS has been conceptually explained should the website show actual product UI.

Suggested headline:

Designed for complex tax operations.

Use one large professional screenshot.

Possible UI:

- Fund
- Reporting period
- Jurisdiction
- Tax calculations
- Calculation status
- Exception status
- Review status

Overlay a smaller Calculation Trace panel.

This section should demonstrate that the platform actually exists.

10. JURISDICTION SECTION

This is highly important for potential customers.

Headline:

One tax infrastructure. Multiple jurisdictions.

Show country cards.

For example:

Switzerland

Swiss Fund Tax Reporting

MVP

Germany

German Investment Tax Reporting

In Development

Austria

Austrian Fund Tax Reporting

Roadmap

United States

US Partnership Tax Intelligence

Roadmap

Each jurisdiction should clearly communicate its status.

Do not present roadmap functionality as currently available.

11. USE CASE SECTION

This is a customer-oriented section.

Headline:

Built around real private-market tax workflows.

Use cards such as:

Fund Tax Calculation

Share-Class Tax Allocation

Investor Tax Reporting

Cross-Border Tax Analysis

K-1 / K-3 Intelligence

Each card should answer:

What problem is solved?

Who uses it?

What output is generated?

Do not simply list technical features.

12. CUSTOMER SEGMENT SECTION

Headline:

Built for the private-markets ecosystem.

Use clear audience cards.

Fund Managers & AIFMs

Centralize tax reporting across funds, entities and jurisdictions.

Fund Administrators

Add scalable tax calculation capabilities to fund administration workflows.

Tax & Accounting Firms

Standardize complex calculations while maintaining professional review.

Institutional Investors

Structure and analyze tax information across private-market investments.
Potential customers must immediately recognize themselves.

13. AI SECTION

This section should educate rather than hype.

Headline:

AI where interpretation matters. Deterministic logic where calculation matters.

Explain clearly:

AI assists with:

- interpretation
- classification
- data extraction
- anomaly detection
- exception handling
- tax research support

Controlled logic executes:

- calculations
- allocations
- tax rules
- reporting mappings

Professional users retain responsibility for:

- review
- judgement
- approval
- exceptions

The website must communicate responsible AI usage.

14. TRACEABILITY SECTION

Headline:

No black-box tax calculations.

Explain the concept visually.

Source Data

↓

Tax Classification

↓

Tax Rule

↓

Calculation

↓

Allocation

↓

Reporting Output

Then show supporting metadata such as:

Rule version

Calculation ID

Source reference

Timestamp

Reviewer

Status

This is one of the strongest trust messages for tax professionals.

15. SECURITY SECTION

This section should serve potential enterprise customers.

Headline:

Built for sensitive financial and tax data.

Explain security architecture and governance principles.

Only state capabilities that actually exist.

Examples may include:

Encryption

Role-Based Access Control

Audit Logging

Tenant Isolation

Data Retention Controls

AI Data Governance

The website should not falsely state external certifications.

16. INTEGRATION SECTION

Headline:

Built to connect with your existing tax stack.

Potential customers need to understand that ZYVORIS does not require replacing every existing system.

Explain connectivity with:

Accounting Systems

Fund Administration Platforms

Portfolio Management Systems

Tax Preparation Software

Data Warehouses

Investor Reporting Platforms

Possible interfaces:

REST API

SFTP

CSV

Excel

JSON

Structured Data Feeds

Document Ingestion

Use technology icons rather than third-party logos unless an integration actually exists.

17. COMPARISON SECTION

This section should explain why the ZYVORIS operating model is better.

Headline:

Replace fragmented tax workflows with connected infrastructure.

Show:

Traditional Tax Workflow

versus

ZYVORIS

Examples:

Multiple	Excel	workpapers
→ Connected data model		
Manual		classifications
→ Structured classification workflow		
Manual		calculations
→ Controlled calculation engine		
Separate	jurisdiction	workflows
→ Multi-jurisdiction architecture		
Manual		reconciliation
→ Automated validation		
Difficult		review
→ Source-to-output traceability		
Knowledge	held	by
→ Versioned tax rules		individuals
Static		deliverables
→ Structured tax data		

This is a commercial explanation rather than a competitor comparison.

18. WEBSITE SHOULD EDUCATE BEFORE ASKING FOR A DEMO

Do not place aggressive CTA buttons after every single section.

Primary CTA placements should be:

1. Navigation
2. Hero
3. Approximately middle of page
4. Final CTA

Smaller text links can be used elsewhere.

The user should first learn about ZYVORIS.

19. FINAL CTA

Headline:

Build tax reporting on infrastructure designed for complexity.

Supporting copy:

See how ZYVORIS connects financial data, fund structures, tax logic, calculations and reporting across complex private-market workflows.

Primary CTA:

Book a Demo

Secondary CTA:

Contact ZYVORIS

20. WEBSITE TRUST PRINCIPLE

The website should always distinguish between:

AVAILABLE

MVP

BETA

IN DEVELOPMENT

ROADMAP

No wording should imply that planned functionality already exists.
This is particularly important for:

- Jurisdictions
- AI capabilities
- integrations
- security features
- reporting capabilities

21. PRODUCT UI VS WEBSITE

The public website and ZYVORIS product application must visually belong to the same brand.

However:

PUBLIC WEBSITE

Purpose:

Explain, educate, establish trust, convert.

Style:

Editorial + technology + institutional finance.

APPLICATION

Purpose:

Perform calculations, review data, manage workflows and generate reports.

Style:

Dense, structured, operational and data-driven.

Do not design the public homepage as if it were the actual application interface.

22. CONTENT PRINCIPLE

Every homepage section should answer one customer question.

Hero:

“What is ZYVORIS?”

Problem:

“Why do I need it?”

Platform:

“What does it connect?”

Workflow:

“How does it work?”

Use

Cases:

“What can I use it for?”

Jurisdictions:

“Where does it work?”

AI:

“How is AI used?”

Traceability:

“Can I understand the calculations?”

Customer

Segments:

“Is this built for my organization?”

Integrations:

“Will it fit into my current environment?”

Security:

“Can we trust it with sensitive data?”

Comparison:

“Why change our current process?”

CTA:

“How do I learn more?”

This question-driven structure should guide the entire website implementation.
